Cardiovascular Disease in Women

Cindy L Grines M.D.
Detroit Medical Center Cardiovascular Institute,
Wayne State University,
Detroit Michigan USA

Learning Objectives

- Compare differences between men and women in risk factors, incidence and treatment of cardiovascular disease
- Define the terms endothelial dysfunction and microvascular disease
Cardiovascular disease kills more women each year than the next four causes of death combined.

Since 1984 more women than men have died of heart disease each year and yet much of the medical community still largely considers it a “men’s disease.”

Gender Differences in Symptoms, Prevention and Treatment of CVD Contribute to a High Number of Fatalities in Women.

Trends in Deaths from Cardiovascular Disease for Males and Females (US: 1979-2006).

Source: AHA 2010 Statistics Update
Women and Heart Disease: US Prevalence

Women are very different than men

- Different cardiovascular risks and benefits
- Hypercoagulable: platelets and thrombin
- Different drug pharmacokinetics
- More side effects to medications
- More bleeding complications
- Less likely to receive guidelines based therapy
Hormonal Influences on cardiovascular disease

- Oral contraceptives associated with 2-3 fold increase in HTN, ↑MI, ↑CVA.
- Gestational diabetes and pre-eclampsia
  ↑cardiovascular risk
- Spontaneous coronary dissection
  - women>>>men
  - ↑prevalence within a few months of childbirth

Other CV Risk Factors in Women

- ↑CRP – greater risk in women than men
- Autoimmune disorders (Rheumatoid arthritis)
- Carrier of HPV (human papilloma virus)
  2-3x ↑risk of MI and CVA
- Radiation for Breast cancer - ↑higher risk of CAD
Traditional Risk Factors for CAD may affect women differently than men

- Smoking –
  - incidence of CAD women > men \(\text{(Lancet 2011;378.1297)}\)
  - incidence of PVD in smokers: women >>> men
  - women who smoke are twice as likely to have MI compared to men who smoke

- Diabetes –
  - causes 50% ↑risk of MI in men, but 150% ↑risk in women
  - metabolic syndrome, insulin resistance > risk in women compared to men

Diagnosis and Treatment of Cardiovascular Disease in Women

- Atypical symptoms
- False positive and false negative stress tests
- Different response to treatments
- More complications from invasive procedures
- More side effects from medications

P = 0.03

P = 0.03
Non-Obstructive CAD is Not Benign

Symptomatic women with non-obstructive CAD have high 5 year cardiovascular event rates

Cardiovascular event rate increases with number of risk factors present

Women with non-obstructive disease and CFR <2.32 had significantly more major adverse outcomes

Endothelial Dysfunction

- Abnormal flow-mediated dilation (or paradoxical vasoconstriction) of epicardial coronaries - associated with increased risk
- Impaired in hypertensive, smoking, hyperlipidemic or diabetic women
- Exacerbated after onset of menopause

Dr. Cindy Grines
What is Microvascular Disease?

- Dysfunction in small coronary arterioles <500 microns in diameter
- Main determinants of vascular resistance
- Major etiological factor for ischemic heart disease in women
- Potential precursor of obstructive CAD
- 2-3 million women with microvascular coronary dysfunction in the U.S.
- ~90,000 new cases annually

Clinical Presentation of Microvascular Ischemia

- Angina – stable and unstable
- ST segment depression
- Abnormal SPECT
- Non-obstructive CAD angiographically
- Abnormal coronary flow reserve (CFR) by intracoronary doppler and elevated LVEDP

Sources:
- Noel Bairey Merz, “Women and Heart Disease: A Changing Paradigm” Presentation
Strategies for Atherosclerosis & Endothelial Dysfunction

ACE Inhibitors
- Lower blood pressure, improve endothelial function
- Improve exercise duration and CFR in patients with microvascular coronary ischemia

Statins
- Lipid-lowering effects
- Improve endothelial function
- Improve CFR and exercise tolerance
- Reduce angina

Low dose aspirin
- Secondary prevention of cardiovascular events

Dr. Cindy Grines
A Systematic Review of Gender Differences in Mortality after CABG and PCI

- Review of randomized trials of CABG (n=23) and PCI (n=48) reporting outcomes based on gender
- Women have a greater number of co-morbidities – older, more diabetes, HTN, CHF and severe non-cardiac disease
- Anatomic differences - women have smaller BSA, smaller coronaries, smaller LV chamber size (low SV and cardiac output)
- Higher early mortality in women – not consistently eliminated after adjustment for co-morbidities

ClinCardiol 2007;30:491-5

A Systematic Review of Gender Differences in Mortality after CABG and PCI: Differences in Treatment

- Late referrals
  - more advanced CAD
  - more urgent/emergent procedures
  - longer DTB times in STEMI cases
- Lower rates of IMA grafts in women even after adjustment for age, extent of disease and urgent surgery
- Similar benefits from GP IIb/IIIa agents and stents
- Improved PCI mortality over time in both men and women

ClinCardiol 2007;30:491-5

Circ 2005;III;940-953
Why do women present late during STEMI?

- Only 53% of women said they would call 9-1-1 if experiencing the symptoms of a heart attack.
- However, 79% said they would call 9-1-1 if someone else was having a heart attack.
- For themselves, 46% of women would do something other than call 9-1-1—such as take an aspirin, go to the hospital, or call the doctor.

Source: Mosca 2010.

Higher Mortality in Women with AMI: NRMI 2 (N=384,878)

"The younger the age of the patients, the higher the risk of death among women relative to men"

Vaccarino et al, NEJM 1999; 341:217
Mechanism of MI May be Different in Women

- Atherosclerotic: plaque erosion: women > men; plaque rupture: men > women
- Spontaneous coronary dissection: women > men
- Spasm (migranes, Raynauds): women > men
- Non-STEMI: women > men (subendocardial ischemia due to LVH, microvascular disease, endothelial dysfunction)
- Takotsubo (high circulating levels of catecholamines): women >>>>> men

CAD in Women: Conclusions

- The risk factor profile in women presenting with ACS and AMI is distinctive compared to men. Women are older, have more HTN, DM, but also unique risk factors related to hormonal influences and inflammation
- Despite having less extensive CAD and better LV function, prognosis is worse than in men – late diagnosis and inadequate treatment
- Symptoms may be atypical – even in the midst of AMI! Have a high level of suspicion.
Cardiovascular Disease in Women

◆ In ACS and AMI women benefit from early invasive strategy; take caution to reduce bleeding and vascular complications.

◆ Women are more likely to have endothelial dysfunction, microvascular disease and angina due to left ventricular hypertrophy and subendocardial ischemia.
  ● “Non-obstructive” CAD does not signify low risk
  ● Ranolazine may be useful in women with angina
